

Artificial Intelligence

Different Perspectives

Connor Hicks, Keith Rubin, and Matthew Zurliene

AI in Surveillance

Keith Rubin

Dataveillance

- **Roger Clarke (1987)**
- **“systematic monitoring of people's actions or communications through the application of information technology”**
- **Superior to physical and communication surveillance**

Internal Ethics

- Metcalf, Moss, & Boyd (2019)
- Interviews with big tech “ethics managers”
- Meritocracy
- Technological Solutionism
- Market Fundamentalism

External Ethics

- **ACM 1999**
 - Public over Product
 - Encourages whistleblowing
 - Privacy in Design
- **ACM 2018**
 - Minimum personal information collected
 - Data aggregation warning
- **AINow 2025**
 - “Inherently centralizing technology”
 - Used for surveillance and military
 - Condemns worker surveillance
 - Self regulation doesn't work

Practical Implications of AI

Connor Hicks

Automations and Augmentation

Automation - is AI dependent and does not require human intervention

Augmentation - is dependant on human intervention as it enhances our abilities to perform tasks

- Marc Pinski

- AI is used for business strategies and small management roles
 - Business are beginning to uncover the full capabilities of artificial intelligence
 - Businesses began only using AI for obsolete tasks and automating small decision

- Marc Schmitt

- Shows how AI is data driven and cannot be used effectively without human aid
 - New competitive markets are trying to feed their computers new data for an advantage
 - Leaving large investments and decisions to humans

Job Implications and Positions

- Beginning a new age of transitions from human managers to AI managers in positions that are not needed
 - Lower end of the business world
 - Interns, people right out of college, starting positions ... etc
- The uprise of AI in business has created turmoil in the relationships between humans and AI
- Wamba-Taguimdje, S.
 - Promising technologies for future organizations
 - No regulations on AI

Decision Making and Trust

- People are still questioning the authenticity and reliability of AI
 - Humans naturally questions things we don't understand
- IT departments of businesses and firms have now exploded in jobs and importance
 - 270% increase in the use of AI in Businesses
- Small and medium sized businesses are using AI for customer support and services
 - Customer satisfaction has improved but people are still finding flukes in different AI systems that cause small inconveniences
 - Causes distrust for large scale decisions

Ethics of AI Technologies

Matthew Zurliene

Introduction

- Surrounds ethical principles, rules, policies, regulations, etc.
- The concept of “machine ethics” was first proposed around 2006, but the discussion of AI ethics is still in its very early stages
- Conflict between “what one wants to do” vs. “what one ought to do”
(Rajakishore & Vineet, 2020)
 - Can we be sure that AI will make the right decision in a situation not anticipated?
- AI often shows human biases because it’s trained on data from humans

Self-Driving Vehicles

- Debates over what car should do when it encounters various situations, if it knows there's about to be an accident
 - Who is at fault if a driverless car gets into an accident?
- Geneva Convention on Road Traffic (signed 1952)
 - Amendment in 2022 changed the idea that the driver is always fully in control
 - Also in 2022, US regulations were updated to allow vehicles without all standard driving controls
- In recent years, companies such as Waymo (US) and AutoX (China) have been operating self-driving taxis
 - Laws vary from state-to-state, but more regulations have been passed just recently (first legislation was in Nevada in 2011)

LLMs

- Lots of discussion surrounding how to regulate LLMs, very little (or no) regulation actually in place
 - Regulate to prevent misuse of the tech or avoid regulation b/c it could hinder innovation?
- Discussion around the ethics of how LLMs are trained on other people's data
 - Artists, writers, creators, etc.
- AI may be designed to take web traffic away from other sources and to the AI instead
